

HACKATHON 2

Sleep Wind Down

KADIR GÜÇLÜ

ANA TALG WOLF

THE PROBLEM

- Heavy screen time negatively affecting mental well-being
- Screen use is difficult to control
- Users may not be aware of how their digital habits affect them
- The impact of screen time on mental well-being is often overlooked

OUR SOLUTION

- Track screen time, mood and stress to increase self-awareness
- Use AI to identify patterns and provide personalized recommendations
- Encourage healthier screen time habits

WHAT IT DOES...

- Daily check-in: User receives a short form to fill out about screen time, mood & stress
- AI analysis: Responses are analyzed to create a personalized wind-down routine
- Personalized support: user gets an email with routine suggestions and tips , based on user input
- Continuous tracking: responses and generated routines are automatically logged in Google Sheets to keep track of the progress

WHO IS IT FOR?

Young adults (16–30 years old) who feel that screens play too big a role in their daily lives and want a simple, personalized push toward healthier digital habits.

WHY THIS GROUP?

- 4.5 hrs average screen time on a school day among EU teens
- 6.1 hrs on weekend days

of 16–30-year-olds use digital devices within 30 min of bedtime

use devices directly before sleeping

of university students report poor sleep quality

WHICH SDG DOES IT ADDRESS?

3 GOOD HEALTH
AND WELL-BEING

TARGET 3.4

**REDUCE MORTALITY FROM NON-COMMUNICABLE DISEASES
AND PROMOTE MENTAL HEALTH**

WHY?

- Heavy screen use can be linked to increased stressed and anxiety
- Excessive screen use before bed is linked to poorer sleep
- Poor sleep and high stress can decrease mental well-being

HOW?

- Helps users recognize their screen habits
- Helps users make healthier choices

ETHICAL CONCERNS

- **Privacy risk**

- The tool collects sensitive data about mood, stress, sleep, and screen time. This data could be misused or reveal private information.
- Action: We only collect necessary data and store it in one Google Sheet without third-party sharing.

- **Wrong interpretation**

- High screen time could be incorrectly seen as unhealthy, for example when a student is studying. This could lead to unsuitable advice.
- Action: The AI considers the context and does not automatically judge high screen time negatively.

- **AI bias**

- The AI may give less accurate recommendations depending on how users write their notes.
- Action: We use supportive, non-judgmental language and avoid labels like “bad” or “unhealthy.”

- **False sense of security**

- Users with serious mental-health problems might rely on the tool instead of seeking professional help.
- Action: Every output says it is not a medical or diagnostic tool and encourages users to contact a GP or professional when needed.

- **User control**

- Users should be able to stop using the tool and control their data.
- Action: Users can stop using the tool and delete their data from the sheet.

****Purpose: The tool supports awareness and small healthy habits, not professional***
